

## Abstract:

The invention relates to a pressure sensor module, in particular for electrohydraulic brake systems, with several pressure sensors arranged in a sensor housing (13) that is connected with its flange surface to the mounting surface of a hydraulic housing (12) in such a fashion that several pressure ducts (14) arranged in the sensor housing (13) and in the hydraulic housing (12) are interconnected. The invention discloses that a cylindrical element (3) provided with two fastening sections (1, 2) is arranged between the flange surface (4) and the mounting surface (5), with the first fastening section (1) being operatively and/or positively connected to the sensor housing (13), while the second fastening section (2) is operatively and/or positively connected to the hydraulic housing (12).
